The present invention is directed to the field of power supplies and more particularly to a power supply having an output that is regulated by a voltage multiplier circuit. Power supplies are often provided with a voltage multiplier circuit to multiply an input voltage. Typically, such circuits provide a set of voltage gain stages to increase the voltage at the output of the power supply. Generally, a fixed set of gain stages are provided to provide different outputs for different values of input voltage. Each gain stage includes one or more switching circuits and control circuits that determine when to operate a switching circuit. The value of the output voltage for a given input voltage can then be provided by simply selecting the gain stage having the desired output. Input voltage can 70238732e0 [Gfx Boot Customizer 1.0.0.6 2851](#)
